

Introduction

Throughout this project, I corrected and edited the content on my website to be clearer, more consistent, and more representative of the data or content that I was displaying. Most of my changes involved the overall formatting of the site, my contextualization in Project 1, and code in Projects 3 and 5.

Across all the projects, I roughly arranged the information into consistent sections (Introduction, Data, Analysis, Conclusions) for clarity and consistency. I also added comments to my code and provided additional information on the sources of the data in Projects 1, 2, 3, and 5, giving relevant context on the variables as well as the collection and/or documentation of the data. Additionally, I revised all my conclusions to better represent and communicate my findings, and I displayed a table with the raw data at the beginning of each project.

I will focus on explaining the major changes in the formatting, Project 3, and Project 5, as these were the areas where I made the most significant edits – that is, edits beyond simple clerical errors. For Projects 2 and 4, I mainly corrected typos or minor errors in the code.

General Formatting and Styling Changes

As I've mentioned in class, I intend to use this site as both an archive and a professional webpage; however, the general formatting – specifically capitalization – didn't really align with these goals and appeared disorganized and informal. I adjusted all the text sentences to begin with capital letters, which made a surprisingly large visual difference, in my opinion. I updated the index.qmd file and the YAML to apply the formatting changes. I also edited the names of the projects in the dataviz dropdown menu to provide more context beyond just the project number. Smaller changes, such as arranging buttons and songs, were applied as well. Additionally, I corrected several typos throughout the page.

I had used ChatGPT to generate some of the CSS styling in my styles.css file, which I removed and replaced with manually written code featuring different color parameters and spacing for the navigation bar.

Project 1

For Project 1, I primarily organized the text and provided much more context on the sources of the data. As I mentioned above, I did this for each project if it hadn't already been completed; however, I am choosing to expand on Project 1 since it had the most substantial additions.

I also edited the code in this project, as it was redundant (filtering more than necessary and not changing anything). I relabeled the axes and rewrote the titles of the graphs, updating the descriptions and conclusions to describe the data and my findings more accurately and concisely. For example, I added a formal introduction to the data and proper citations for the datasets. Additionally, "Runtime" and "Amount of Cheese", the vague axis labels/variables from before, are now Magnitude of Cheese Types (milk used) by Country and Number of Different Cheeses from Animal to better represent the data. I also ensured that I hid warning messages and removed extra, unnecessary code.

Project 3

Among all my revisions, Project 3 required the most intensive editing. For Project 3, I adjusted my argument to better reflect the central questions I was pursuing. The questioning, data, and conclusion had minor imperfections in how I referenced the columns, as I unconsciously began to reference the 'rating' column incorrectly, conflating ratings (i.e., PG-13) and ratings (i.e., 5 stars, good/bad, etc.). Generally, I ensured that my analysis was consistent throughout the project and corrected my representation of the statistical analysis.

I changed the references to the variables from independent to dependent to explanatory and response. I added the observed statistic as a vertical line on the null distribution, and I removed some lines of redundant code, or code that unnecessarily altered my results without adding anything substantial (over-filtering).

I altered the code to properly clean the data (removing another redundant, unneeded filter()) and to include additional ratings that could be classified as mature (NR, UR). My results were very different (now reflected on the page), suggesting a much stronger relationship between time and ratings. I edited my conclusions to account for these changes.

Project 5

I made small but important changes in my observations and analysis by refining my descriptions to better explain the database and datasets, making sure to define them separately. I also ensured to include the formal citation for the SOPP.

I revised my analysis of New Orleans to eliminate useless averaging, as the returned value didn't provide any insights due to my calculation method. I edited the SQL chunk (replacing HAVING with LIMIT) for efficiency, ensuring it displayed only the top five locations.
